assignment problems is a useful tool for researchers practitioners and graduate students in 10 self contained chapters it provides a comprehensive treatment of assignment

problems from their conceptual beginnings through present day theoretical algorithmic and practical developments the topics covered include bipartite matching algorithms linear assignment problems quadratic assignment problems multi index assignment problems and many variations of these researchers will benefit from the detailed exposition of theory and algorithms related to assignment problems including the basic linear sum assignment problem and its variations practitioners will learn about practical applications of the methods the performance of exact and heuristic algorithms and software options this book also can serve as a text for advanced courses in areas related to discrete mathematics and combinatorial optimisation the revised reprint provides details on a recent discovery related to one of jacobi s results new material on inverse assignment problems and quadratic assignment problems and an updated bibliography

with the large amount of data stored by many organizations capitalists have observed that this information is an intangible asset unfortunately handling large databases is a very complex process and traditional learning techniques are expensive to use heuristic techniques provide much help in this arena although little is known about heuristic techniques heuristic and optimization for knowledge discovery addresses the foundation of this topic as well as its practical uses and aims to fill in the gap that exists in current literature

a bestseller in its french edition this book is original in its construction and its success in the french market demonstrates its appeal it is based on three principles 1 an organization of the chapters by families of algorithms exhaustive search divide and conquer etc on the contrary there is no chapter devoted only to a systematic exposure of say algorithms on strings some of these will be found in different chapters 2 for each family of algorithms an introduction is given to the mathematical principles and the issues of a rigorous design with one or two pedagogical examples 3 for the most part the book details 150 problems spanning seven families of algorithms for each problem a precise and progressive statement is given more importantly a complete solution is detailed with respect to the design principles that have been presented often some classical errors are pointed out roughly speaking two thirds of the book is devoted to the detailed rational construction of the solutions

highlighting and illustrating several important and interesting theoretical trends that have emerged in the continuing development of instructional technology this book s organizational framework is based on the notion of two opposing camps one evolves out of the intelligent tutoring movement which employs artificial intelligence technologies in the service of student modeling and precision diagnosis and the other emerges from a constructivist developmental perspective that promotes exploration and social interaction

but tends to reject the methods and goals of the student modelers while the notion of opposing camps tends to create an artificial rift between groups of researchers it represents a conceptual distinction that is inherently more interesting and informative than the relatively meaningless divide often drawn between intelligent and unintelligent instructional systems an evident trend is that researchers in both camps view their computer learning environments as cognitive tools that can enhance learning performance and understanding cognitive tools are objects provided by the instructional environment that allow students to incorporate new auxiliary methods or symbols into their social problem solving which otherwise would be unavailable a final section of the book represents researchers who are assimilating and accommodating the wisdom and creativity of their neighbors from both camps perhaps forming the look of technology for the future when the idea of model tracing in a computer based environment is combined with appreciation for creative mind extension cognitive tools and for how a community of learners can facilitate learning a camp is created where ai technologists and social constructivist learning theorists can feel equally at home

this volume covers the whole spectrum of artificial intelligence including knowledge representation automated reasoning constraint based reasoning machine learning autonomous agents human language technology planning vision and robotics and ai aspects of uncertainty and of creativity the book further includes contributions on innovative application all contributions are peer reviewed by an international programme committee

this book constitutes the refereed proceedings of the 9th international conference on logic programming and nonmonotonic reasoning lpnmr 2007 held in tempe az usa may 2007 this conference encompasses theoretical studies design and implementation of logic based programming languages and database systems and development of experimental systems
